# Introduction

## Working on $\textbf{Cryptography} \Rightarrow interested in <math display="inline">\textbf{Error Correction}$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Outline

- Passwords
- Research Question(s)
- Hamming Distance
- Correcting Public Errors
- Correcting Private Errors
- Applications
- Better Error Correction Codes?

## Passwords

- ▶ Store them in **cleartext** ⇒ insecure
- Solution: store them hashed

Definition (Cryptographic Hash Function, One-Way Function) Map  $H: \{0,1\}^n \to \{0,1\}^m$  (typically  $m \ll n$ ) which is **pre-image resistant**: given  $h \in \{0,1\}^m$  it is difficult to find  $x \in \{0,1\}^n$  such that H(x) = h.

# Research Question(s)

Can we:

- securely encode and match fingerprints ...
- ... as well as other biometric features (iris scans, DNA, etc.)?
- hash passwords in a way that allows for (small) errors?

## Example

$$x = (P, a, S, w, o, r, d, 1, 2, 3),$$
  
$$y = (P, A, s, w, o, r, d, 0, 2, 3)$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

## Hamming Distance

Without loss of generality, work over the **binary** set  $\mathbb{F}_2 = \{0, 1\}$ . Definition (Hamming Distance)

Let  $n \in \mathbb{N}$  and  $x, y \in \{0, 1\}^n$  be two binary vectors. The **Hamming distance** between x and y is then given by

$$d_H(x, y) = \#\{i \mid x_i \neq y_i\}.$$

Example

$$\begin{aligned} x &= (1, 0, 1, 1, 1, 0, 0, 1), \\ y &= (1, 1, 0, 1, 1, 0, 0, 0) \\ \Rightarrow d_H(x, y) &= 3 \end{aligned}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

# Hamming Distance

#### The **Hamming ball** $B_{H,r}(x)$ of radius *r* around a vector *x*:

$$B_{H,r}(x) = \{y \mid d_H(x,y) \leq r\}$$

#### Example

 $B_{H,1}(000) = \{000, 100, 010, 001\}$  $B_{H,2}(000) = \{000, 100, 010, 001, 110, 101, 011\}$

# Correcting Public Errors

## Definition ((Linear) Error Correction Code)

A linear [n, k, d] error correction code is

- ▶ a generator matrix  $G \in \mathbb{F}_2^{n \times k}$ , together with
- a polynomial time decoding algorithm

such that the minimal Hamming distance between codewords is d.

#### Example

A k-length input  $x \in \mathbb{F}_2^k$  is mapped to an *n*-length codeword  $c = Gx \in \mathbb{F}_2^n$ . Two distinct codewords  $c_1 = Gx_1$  and  $c_2 = Gx_2$  have Hamming distance at least  $d: d_H(c_1, c_2) \ge d$ .

# Correcting Private Errors

In cryptography, we reduce to (computationally) hard problems. Definition (Modular Subset Product Problem, MSP) Let  $r, n \in \mathbb{N}$ , a secret  $x \in \{0, 1\}^n$ ,  $(p_i)_{i=1,...,n}$  a sequence of small primes, a prime  $q \sim \prod_{r \text{ largest } p_i} p_i$ . Given

$$\triangleright X = \prod_{i=1}^{n} p_i^{x_i} \mod q,$$

the problem is to find x.

#### Example

$$(p_i)_{i=1,\dots,6} = (2, 3, 5, 7, 11, 13),$$
  
 $q = 389,$   
 $X = 2^1 3^1 5^0 7^0 11^1 13^1 \mod 389 = 858 \mod 389 \equiv 80$ 

## Correcting Private Errors

Definition (Fuzzy Hamming Distance, [Galbraith, Z., 2019]) Let  $r < n/2 \in \mathbb{N}$ . Given  $(p_i)_{i=1,...,n}$ , q as in (MSP), output X as an **encoding** of a secret  $x \in \{0, 1\}^n$ .

• Given  $y \in B_{H,r}(x)$ , compute  $Y = \prod_{i=1}^{n} p_i^{y_i} \mod q$ , then:

$$E = XY^{-1} \mod q = \prod_{i=1}^n p_i^{x_i - y_i} \mod q = \prod_{i=1}^n p_i^{e_i} \mod q.$$

- ► Recover e ∈ {−1,0,1}<sup>n</sup> from E by expanding E/q into a continued fraction and factoring.
- Decoding fails if  $\sum_{i=1}^{n} |e_i| > r$  as then  $\prod_{i=1}^{n} p_i^{e_i} > q$ .

# Applications

## Securely encoding and matching fingerprints ...

- ... as well as other biometric features (iris scans, DNA, etc.).
- Password hashing that allows for errors.

## Example

$$x = (P, a, S, w, o, r, d, 1, 2, 3),$$
  
$$y = (P, A, s, w, o, r, d, 0, 2, 3)$$

## Better Error Correction Codes?

Take a step back and consider (MSP) again,

$$arphi: \mathbb{Z}^n o (\mathbb{Z}/q\mathbb{Z})^{ imes}, \ x \mapsto \prod_{i=1}^n p_i^{\mathbf{x}_i} \mod q$$

Algebra tells us that  $\Lambda = \ker \varphi$  is a **lattice** [Ducas, Pierrot, 2018].

- Given x = v + e for some v ∈ Λ and a bounded (short) error vector e ∈ Z<sup>n</sup>, finding v is another hard problem (Bounded Distance Decoding, BDD).
- Future research: find Λ such that encoding and error size are optimal and BDD is easy.
